

eatWell App by Keith Bradley

About the App

Everyone is getting tired of the masses of generic unhealthy ambiguous food choices when going out to eat - eatWell is the solution.

eatWell is a yelp style app for searching venues and restaurants and sharing your food experience, but becomes totally different when eatWell allows you to label tags and descriptions of your eating needs creating a place to find info about specific dietary choices.

Lessons Learned

I've firmly grasped the concepts of building real apps in object based coding language.

Firebase - Learned about working with a database

- Create

- Read

- Update

- Destroy

API - SquareSpace API connected to this site to access data about their venues and use this info to search for locations and venue names in my app.

Angular Framework

Does cool stuff, barely scratched the surface, enjoyed model & repeat instant results working with this framework.

Factories - building functions that speak to the database

Controllers - functions that handle passing of data back and forth from factories and the DOM
